BIEE Seminar

The Energy White Paper: An Academic Critique BERR, 25th September 2007

CARBON CAPTURE AND STORAGE

Jon Gibbins and Hannah Chalmers

Energy Technology for Sustainable Development Group Mechanical Engineering Department Imperial College London

j.gibbins@imperial.ac.uk

UK CARBON CAPTURE AND STORAGE CONSORTIUM http://www.ukccsc.co.uk

But all marks are entirely subjective and personal! Even with second marking!

Objective Performance Measures for candidate D. Berr

	EWP2003	EWP2007
Carbon capture	8	57
CCS	12	134
CC+CCS	20	191
Renewable	217	502
Coal	79	158
Clean coal	1	3 Retter than last
Nuclear	55	³ Better than last 435 attempt but still room 2.6 for improvement 5110?
Renewable/(CC+CCS) 10.9	2.6 for imprace
Coal/(CC+CCS)	9.9	
Nuclear/(CC+CCS)	2.8	2.3 Jenerous for
Renewable/Nuclear	3.9	1.2 this section?
		2.8 Generous for 2.3 ^{this} section? But OK.

Imperial College
LondonSummary of measuresEWP2007, pg 178We are committed to enabling the development of low carbon fossil fuel

fired power generation:

National actions

• We committed in the Budget in 2007 to launch a competition to support the commercial-scale demonstration of CCS.

When operational, this will make the UK a world leader in this globally important technology.

Demonstration will enable the technology to be proven and will contribute to the roll out of CCS on a national and international basis. *Check later*.

• To support the potential deployment of CCS we will be launching a consultation on the options for the regulation of the full chain of CCS technologies later this year.

• We will be awarding contracts shortly to the successful prototype projects under the Carbon Abatement Technology (CAT) strategy to develop technologies for fossil fuel use that abate emissions.

• Later this year we will launch a consultation on the issue of capture readiness in future applications for consent under Section 36 of the Electricity Act. Is this worth a second mark? Repeat of point 2?! • We will publish our joint study with Norway on the infrastructure needed to transport and store carbon dioxide below the North Sea in July 2007.

• We will work with the European Commission and other Member States on an EU strategy to develop CCS for new fossil fuel power stations by 2020, if technically and economically feasible to do so.

• We will continue to promote the reform of international regulations affecting CCS. Bonus here for excellent, recent, progress

• We are actively pursuing recognition of CCS in Phase II of the EU Emissions Trading Scheme and full inclusion within the scheme beyond 2012.

• Work on Phase I of the Near Zero Emissions Coal project in China is underway, as is dialogue with other countries on the demonstration/deployment of CCS. Tass, obviously simple just arithmetical slip

CCS demonstration in the UK could save 0.25 -1.0 Mt/yr of carbon by 2020(depending on the size, technology and the number of demonstration powerstations built).Worrying though, would expect candidate tonotice order-of-magnitude error at this level

Imperial College Following the 2007 Budget announcement, the Government is engaged in designing a <u>competition framework for the UK CCS demonstration</u>. Our intention is to launch the competition in November 2007. We recognise that individual companies will incur significant costs to participate in the competition. The Government is therefore committed to regular progress meetings with project developers and publication of competition details as they are decided. We will hold early discussions on the timetable for the competition including the relative merits of a one or two phase competition. The criteria against which proposals will be assessed are likely to include the need for any project proposal to: But, is it, just, one project, or more - CCS isn't, - be located in the UK; just, one technology!

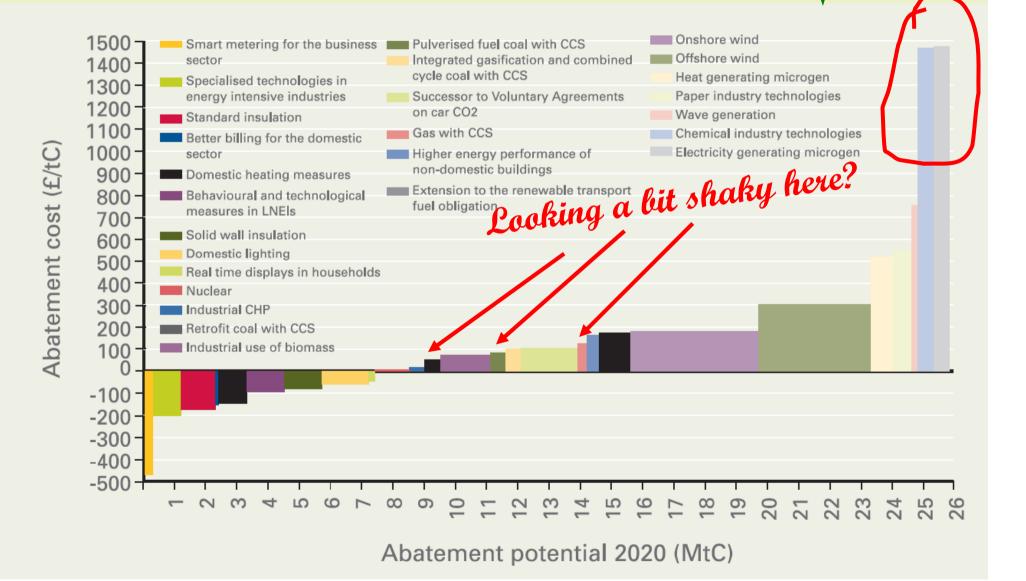

- cover the full chain of CCS technology on a commercial scale power station (capture, transport and storage);

- be based on sound engineering design (reliable and safe) underpinned by a full front-end - set out the quantum of financial support requested: *flexibility if they keep it, in*

– be at least 300MW, and capture and store around (90%) of the carbon dioxide and thereby contribute at least an additional 0.25 Mt/yr of carbon savings to the UK's domestic abatement targets (relative to a gas-fired power station of equivalent size without CCS); - start demonstrating the full chain of CCS at some point between 2011 and 2014; - address its contribution to the longer term potential of CCS in the UK, (for example, through the potential of shared infrastructure) and to the international development of – be supported by a creditworthy developer entity. Looks OK?

EWP2007, pg 176

Why bother with this? FIGURE 10.2. MARGINAL ABATEMENT COST CURVE 2020

Under the central fossil fuel price assumptions published alongside this White Paper, each technology or policy option was compared against a counterfactual in order to calculate its carbon abatement potential – for example, in the case of electricity generation, the alternative source of generation was assumed to be a new combined cycle gas turbine (CCGT)

station. For energy efficiency and transport options, assumptions were made about the fuel displaced and their associated emissions talking about? OK here maybe they know what they are talking about?

The curve should not be taken as a prediction of the exact volume of carbon abated from each technology or policy, since the precise impact of policies, and the timing of the entry and cost of a new technology, are both subject to some uncertainty. This is particularly true for emerging technologies, such as Carbon Capture and Storage (CCS), which is yet to be developed on a commercial scale.

Does candidate understand implications of counterfactual choice? And difficult to get all relevant factors into economic assessment!

(checking marking scheme against another paper – see comments over)

AN ENERGY POLICY FOR EUROPE

10 January 2007 http://ec.europa.eu/energy/energy_policy/index_en.htm

To provide global leadership, the EU must provide a clear vision for the introduction of CCS:

- Regulatory framework (including EU ET\$)
- More and effective research
- International action
- By 2020 all new coal-fired plants should to be fitted with CCS
- Existing plants should then progressively follow the same approach

The Commission will in 2007 start work to stimulate construction and operation by <u>2015</u> of <u>up to 12 large scale demonstrations</u> of sustainable fossil fuels technologies in commercial power generation in the EU25.

The Commission will assess .. whether, if not equipped with CCS, <u>new coal- and gas-fired installations</u> are prepared for later addition of CCS technologies ('<u>capture ready</u>'). If this turns out <u>not</u> to be the case, the Commission will consider proposing legally binding instruments <u>as soon as</u> <u>possible</u>, after a proper impact assessment.

possible, after a proper impact assessment. Candidate E. Union looking good, but evidence of copying?

EU ENERGY SUMMIT: A NEW START FOR EUROPE?

http://www.euractiv.com/en/energy/eu-energy-summit-new-start-europe/article-162432 Published: Tuesday 13 March 2007 | Updated: Friday 29 June 2007

The European Council on 9 March 2007 backed Commission proposals on energy and climate change, agreeing on an action plan to put in place a European energy policy by year 2009. The most significant progress was achieved in the following areas:

Greenhouse-gas reduction:

• <u>A binding target to reduce EU emissions by 20% by 2020</u>, regardless of progress made in international negotiations for a post-Kyoto agreement, and;

• a binding 30% target should other industrialised nations including the US take <u>similar steps</u>. I thought we didn't try to pick winners?

Renewable energies:

• <u>A binding target to have 20% of the EU's overall energy consumption</u> coming from renewables by 2020, and;

• as part of the overall target, a binding minimum target for each member state to achieve at least 10% of their transport fuel consumption from biofuels. However, the binding character of this target is "subject to production being sustainable" and to "second-generation biofuels? becoming commercially available".

Energy efficiency:

• Achieve the Commission's objective of saving 20% of the EU's energy consumption compared to projections for 2020;

 by 2008: Commission to make proposals for increased energy savings from office and street lighting

• by 2009: Commission to make proposals for increased energy savings from incandescent lamps and other lighting in private households.

E. Union's moved on to a different track here? Typical case of a student writing down the answer they've prepared in advance rather than trying to answer the actual question?

Presidency Conclusions of the Brussels European Council

(8/9 March 2007)

10. Aware of the huge possible <u>global</u> benefits of a sustainable use of fossil fuels, the European Council:

 underlines the importance of substantial improvements in generation efficiency and clean fossil fuel technologies;

• urges Member States and the Commission to work towards strengthening R & D and developing the necessary technical, economic and regulatory framework to bring environmentally safe carbon capture and sequestration (CCS) to deployment with new fossil-fuel power plants, <u>if possible</u> by 2020;

• welcomes the Commission's intention to establish a mechanism to stimulate the construction and operation by 2015 of up to 12 demonstration plants of sustainable fossil fuel technologies in commercial power generation. What does E. Union mean by this? Imperial College

OK, will have to check the sums here — see below

• The new EU energy 2020 committed targets look quite like the IEA World Energy Outlook 'Alternative Policy Scenario' for the EU in 2030.

• The APS examines what might happen "if countries were to adopt all of the policies they are currently considering related to energy security and energy-related CO2 emissions."

 i.e. Current EU commitments are more of the same delivered more quickly.

• Will use WEO 2006 APS results for the EU to examine what happens with these commitments but without CCS. Not very happy with your approach – unrealistic to ignore CCS? Not ideal, but maybe OK as simplified hypothetical case?

Imperial College

WEO 2006 APS EU energy & CO₂ emissions

• With new renewables and biofuels targets 20% CO₂ target is nearly reached

- Energy efficiency targets would give significant further CO₂ reductions
- Gas burn up by about 25%, oil consumption down by about 10% from 2004

20% cut from WEO 2006 Reference Case for 2030 = 1578 Mtoe

						~	2020		A: Lo	ow Co			ow Ga	S	B plus 20% demand red'n	
Total primary energy	1990		2004		2015		2030		Adj.	New	%	Adj.	New	%	New	%
supply (Mtoe)	1546		1756		1877		1848			1848			1848		1578	
Coal	427	28%	311	18%	281	15%	182	10%	-60?	122	7%	+100	282	15%	241	15%
Oil	591	38%	656	37%	671	36%	620	34%	-25?	595	32%	-25?	595	32%	508	32%

Gas	571	15%	962	25%	1080	28%	1204	35%		1 20 4	38%		836	24%	714	24%

20% cut on 1990 emissions = 3046 Mt/yr

WEO 2006 APS EU electricity generation mix

- With new renewables targets coal can be reduced by third from APS to ~12%
- Renewables and hydro about 40% of generation
- Gas generation up by about 40% from 2004 values
- Energy efficiency aspirations not included

Case A adjustments

EU electricity	1990		2004		2015		2030		Adj	New
Total generation (TWh)	2444		3154		3484		3681			
Coal	1012	41%	975	31%	955	27%	657	18%	-6%	12%?
Oil	205	8%	131	4%	121	3%	53	1%		1%
Gas	159	7%	605	19%	617	18%	856	23%		23%
Nuclear	778	32%	988	31%	995	29%	822	22%	+3%	25%?
Hydro	271	11%	300	10%	369	11%	405	11%		11%
Renewables (ex. hydro)	19	1%	156	5%	427	12%	888	24%	+3%	27%?
Biomass & wastes	14	1%	90	3%	144	4%	191	5%		5%
Wind	1	0%	59	2%	261	7%	586	16%	+3%?	19%?
Geothermal	3	0%	6	0%	8	0%	17	0.5%		0.5%
Solar	0	0%	1	0%	12	0%	77	2%		2%
Tide & wave	1	0%	1	0%	2	0%	18	0.5%		0.5%

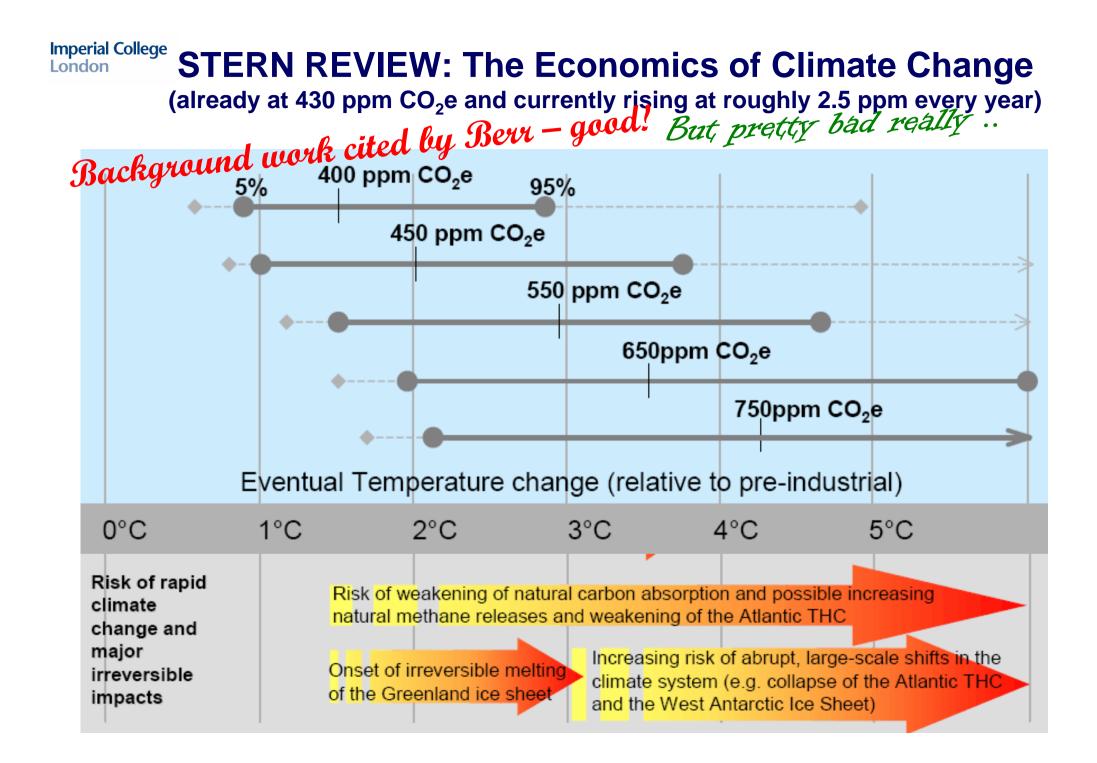

IF binding commitment for 20% of energy from renewables by 2020 is met,

- and there is some progress on biofuels, Why assume transport
 and a lot of progress on biofuels renewables is all biofuels?
- and some existing nuclear is life-extended,
- **THEN** we get oil consumption down by 10%,

But what and we can get 20% CO₂ reductions without So technically correct but shows worrying lack CCS. of awareness of practical aspects of this topic

Imperial College BUT WHAT IF:

- renewables target not met despite being binding?
- demand increases especially more electricity?
- biofuels impractical or small GHG gain?
- Russian gas supplies squeezed in 20-teens?
- nuclear has to be closed, replacements slow?
- strong competition for oil?
- China and India are looking to the EU for a lead on CCS?
 Senalise candidate Union for failing to mention above points.

Imperial College

Carbon capture and storage international context

5.4.11 It is in our own vital interest that the technologies necessary to make coal low carbon are developed and deployed as rapidly as possible, since fossil fuel generation will remain a significant part of the global energy mix (on the Governments' present policies meeting almost 70% of global electricity demand by 2030). The Government believes that the development and wide-scale deployment of CCS is therefore important for our climate change and security of supply objectives. CCS has the potential to reduce carbon dioxide emissions from fossil fuel power stations by as much as 90%. The Stern Review highlighted the strategic role that CCS technology could play globally to lower carbon emissions, with the potential to contribute up to 28% of global carbon dioxide mitigation by 2050, particularly in fast-growing economies with rising fossil fuel consumption such as China and India.

EWP2007, pg 173

5.4.12 In order to deploy CCS in these countries the technology needs to be demonstrated on a commercial scale. Developing countries strongly indicate it is for developed countries to show leadership and to prove the validity of the technology, firm up costs and reduce technical risks.

Looks pretty sound here? $\sqrt{}$

Imperial College
London5.4.20 There is a strong case for the UK demonstration of CCS on power
generation. The UK is well served with potential carbon dioxide storage sites,
particularly under the seabed in the North Sea. Providing financial support and hosting
UK-based CCS demonstration will help the Government meet its aims for climate change
and wider energy policy goals by:

• reducing risks and demonstrating costs of CCS, and taking the first step towards longer term cost reductions and the deployment of CCS on a wide scale nationally and <u>more importantly</u>, internationally;

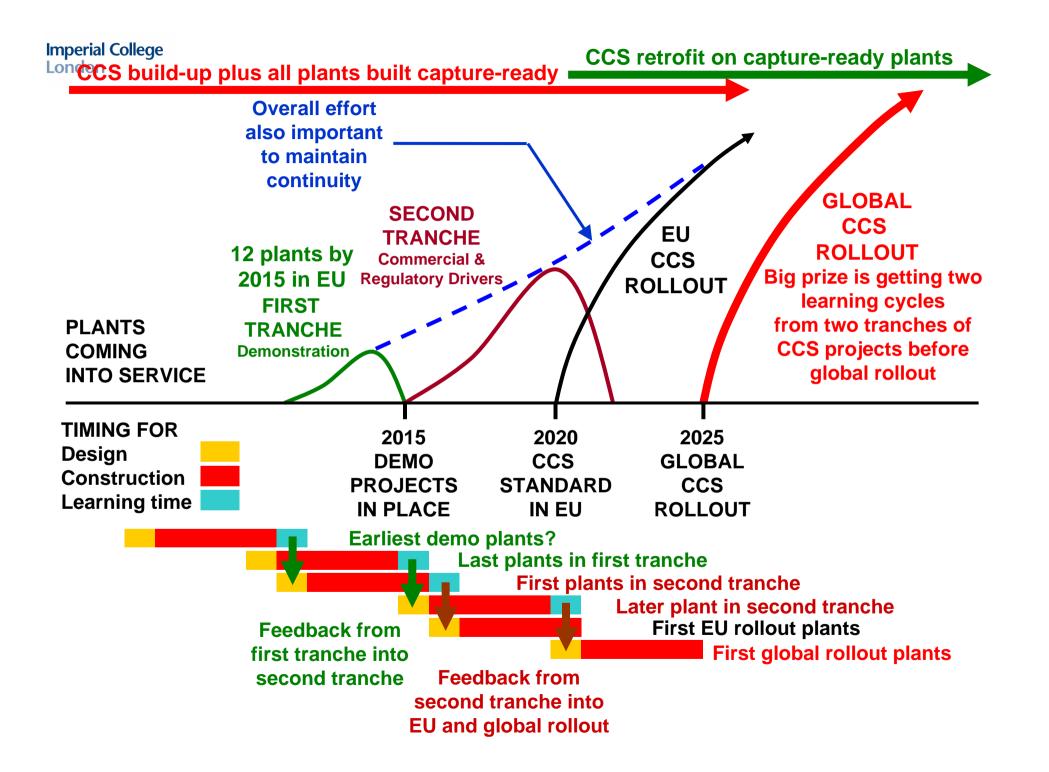

reinforcing the UK's international leadership on climate change by investing in CCS technology that in time has the potential to make substantial reductions in global carbon dioxide emissions;
 Excellent – got there in the end.

helping to gain global agreement for a more ambitious drive to reduce emissions by demonstrating that CCS can safely deliver large reductions in emissions, and the extent to which it is affordable and reliable; *but We're not at the ford yet?*!
giving UK business a lead in the design, construction and operation of CCSnd Yet?!

• giving UK business a lead in the design, construction and operation of CCS^{DA} Yet?! technologies. This will have the advantage of helping to build the skills base and demonstrate supply chains in the UK building on the existing experience and expertise in the UK of operating in the UK Continental Shelf. This should help put UK business in a stronger position to take advantage of future CCS investment opportunities; and

• enabling the UK to develop a comprehensive regulatory framework for CCS.

EWP2007, pg 175

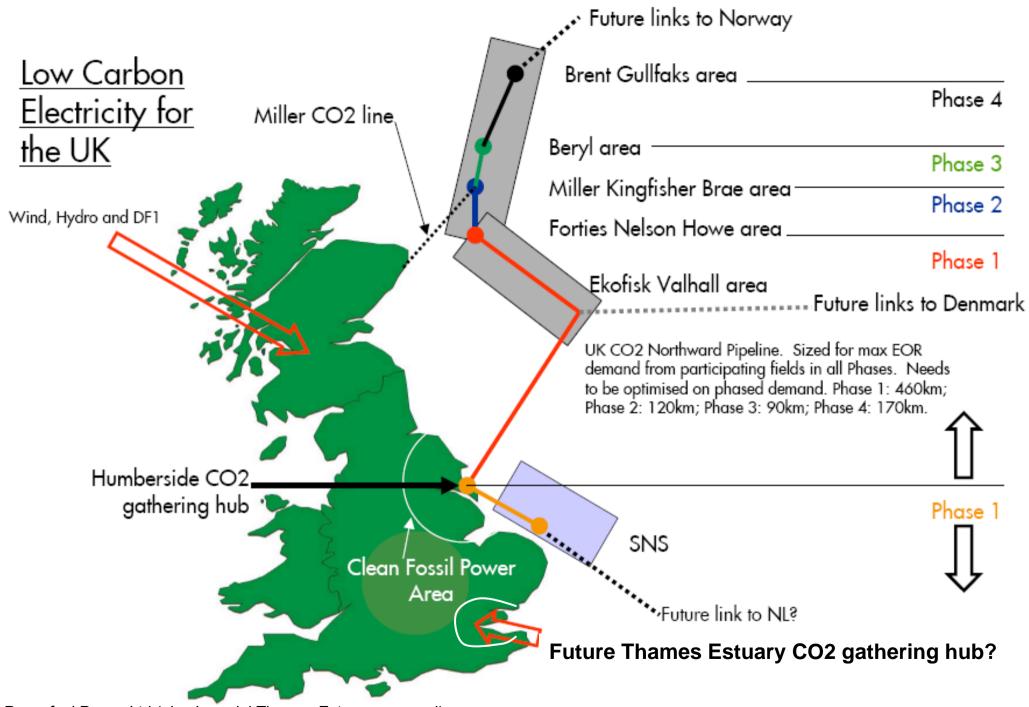

CCS Proposals – UK

Proposed full-scale (~300 MWe and above) CCS projects - indicative only

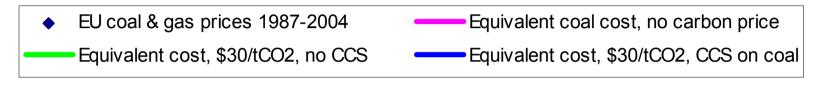

Project	Fuel	Plant output	Capture technology
Progressive Energy /Centrica, Teeside	Coal (petcoke)	800 MW	IGCC + shift + precombustion
Powerfuel/ Kuzbassrazrezugol Hatfield Colliery	Coal	~900 MW	IGCC + shift + precombustion Shell gasifier
Conoco-Phillips, Immingham	Coal (+petcoke?)	450 MW (or more, with retrofit)	IGCC+CCS addition to planned NGCC CHP plant
E.ON, Killingholme, Lincolnshire coast	Coal (+petcoke?)	450 MW	IGCC + shift + precombustion
RWE, Tilbury	Coal	2 x 800 MW	PC, CR, new supercritical, post-com
SSE, Ferrybridge	Coal	1 or 2 x 500MW	PC, CR, supercritical retrofit, oxyfuel
E.ON, Kingsnorth	Coal	2 x 800MW	PC, CR, new supercritical, post-com
RWE, Blyth	Coal	3 x 800MW	PC, CR, new supercritical
Scottish Power, Longannet	Coal	~ 2400 MW	PC, CR, supercritical retrofit, (oxyfuel?)
Scottish Power, Cockenzie	Coal	~ 1200 MW	PC, CR, supercritical retrofit, (oxyfuel?)

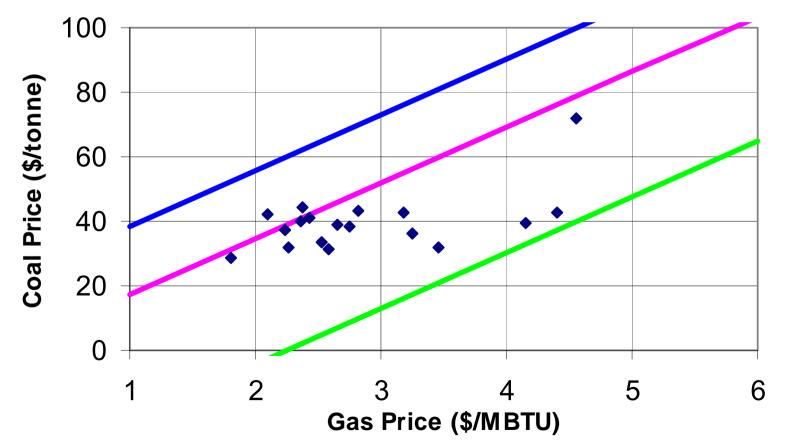

Any possibility of ~13 GW - not including Peterhead/Miller? capture-ready NGCC

Powerfuel Power Ltd (plus Imperial Thames Estuary proposal)

Coal + CCS has LOW marginal costs compared to high cost LNG. Having a coal option, with an option for CCS, is a great way to negotiate reasonable LNG contracts

Distributed vs Central Generation

	kWh in		kWh out	kWh out	kg CO2
	gas LHV		heat	electricity	
	100	Condensing boiler (100% LHV)	100	0	20
16% less	100	CHP with local networks (90% LHV)	55	35	20
gas use , and 16%	63.6	NGCC + trans. Loss (55% LHV)		35	12.7
ower CO ₂		Condensing boiler (100% LHV)	55	0	11.0
missions with CHP	118.6				23.7
	72.9	NGCC + CCS (48% LHV - 80% CO2 reduction)		35	2.9
		Condensing boiler (100% LHV)	55		11.0
	127.9				13.9
	72.9	NGCC + CCS (48% LHV - 80% CO2 reduction)		35	2.9
	57.3	NGCC + CCS (48% LHV) + heat pump (COP=2)	55	0	2.3
	130.2				5.2
	72.9	NGCC + CCS (48% LHV - 80% CO2 reduction)		35	2.9
	38.2	NGCC + CCS (48% LHV) + heat pump (COP=3)	55	0	1.5
	111.1				4.4

Imperial College London CONCLUSIONS – THE COMPETITION IS CENTRAL

- No practical experience = No meaningful CCS options
- Plenty of serious UK players
- Costs probably less than offshore wind
- Three types of things to do not a straight competition :
 - IGCC (3 types or more?) on Teeside or Humberside
 - Commercial post-com ~1000 tCO₂/day on coal next
 - EOR scheme Peterhead only existing pipeline
- Canada, Norway, NL all going slow on early demo projects
- Maybe one or two plants in Australia but LNG & CTL?
- Maybe the USA will start moving after the election?
- Maybe we'll save wasting 2-5 years?

Imperial College CONCLUSIONS - THE C **IS CENTRAL** Candidate Berr knows all the • N(CCS options material but still hasn't answered • Pl <mark>the main question yet — probably</mark> • Cc distracted by other students • Th competition : playing about so deserves another Humberside chance — hard worker too on coal next recommend allow re-examination pipeline end of next year under first-time / demo projects Car Agree, but needs to take it seriously this time, can t NG & CTL? • May rules. afford to see 2-5 years May ection? wasted, and can we rely on USA anyway? May
