# Natural Gas in the UK – a stepping stone or an endpoint?

**Presentation for the BIEE** 

October 2015

# Many projections suggest gas maintains its current share

: vivideconomics

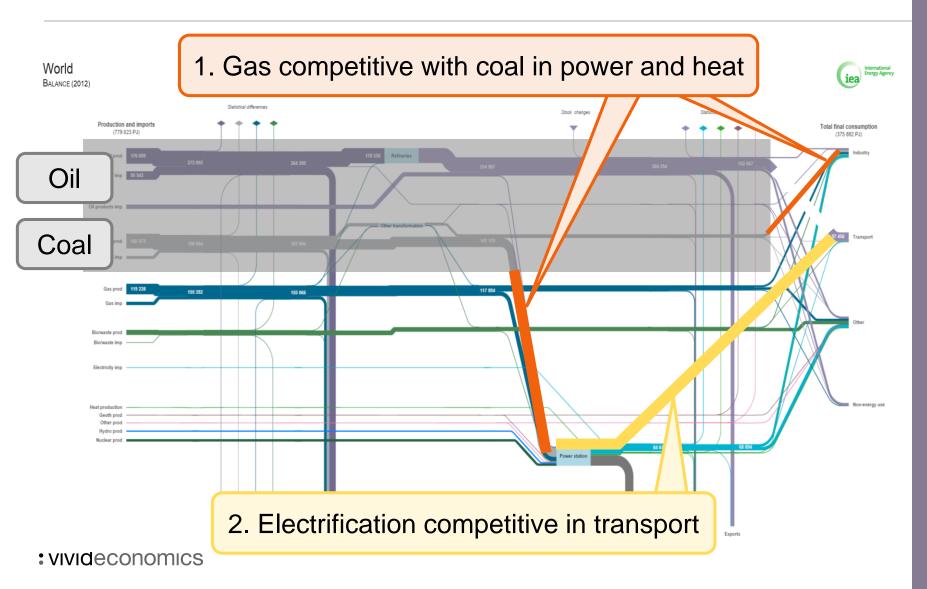

# Gas as an endpoint in the UK depends on six conditions

- 1. gas competitive with coal in power and heat generation (with CCS or carbon price)
- 2. electrification competitive in transport
- 3. limited supply of renewables
- 4. gas competitive with renewables (with CCS or carbon price)
- 5. gas competitive with storage (with CCS or carbon price)
- 6. secure gas supply

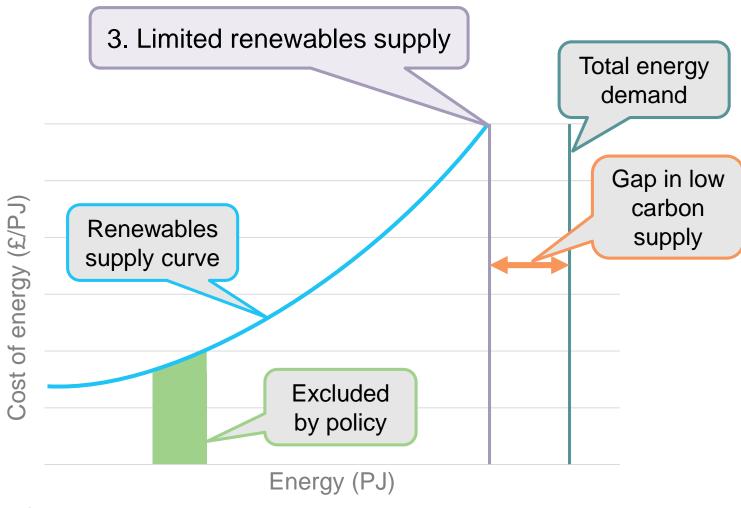

these are primarily driven by global factors

: vivideconomics

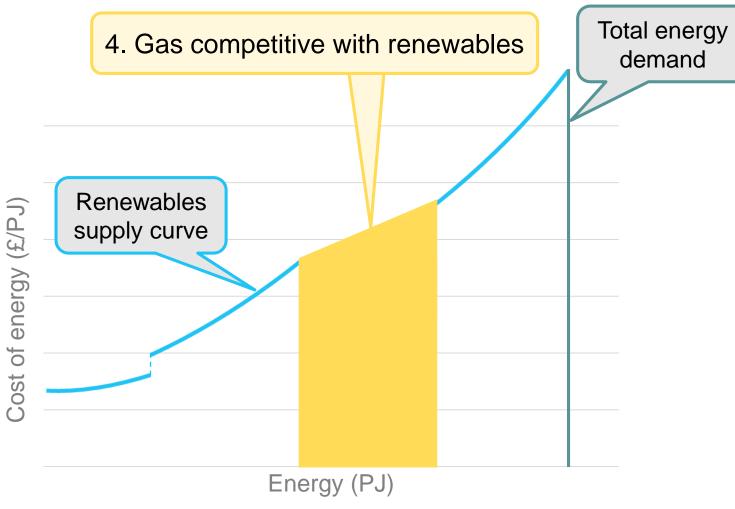

Decarbonisation requires new energy sources for power, high grade heat and transport

# Renewables supply may face limits: physical or political

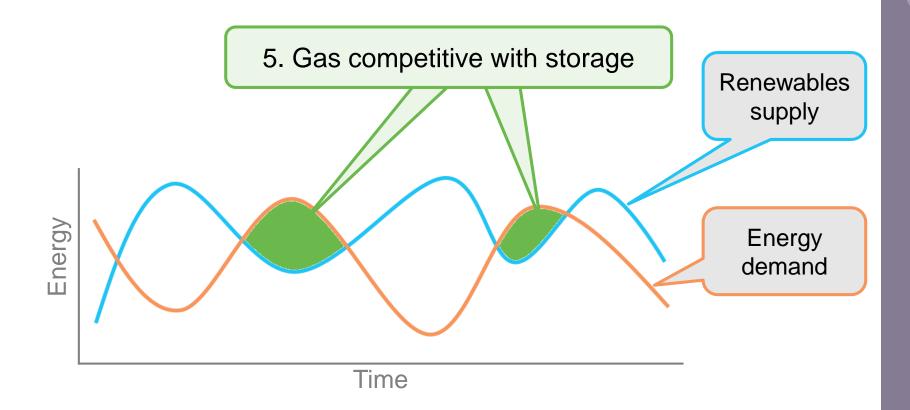

# Gas with CCS may be competitive with marginal renewables

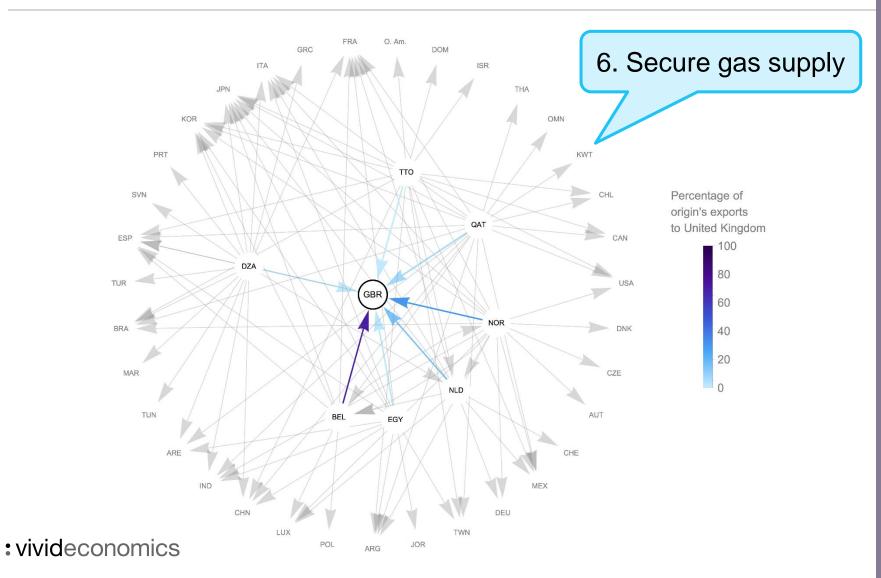

: vivideconomics

## Renewables intermittency requires gas or storage

: vivideconomics

# Security through trade is improving as LNG connects markets

# Prospects for most conditions are uncertain

#	Condition	Criteria	Prospects
1.	Gas competitive with coal	gas price + CCS/CO <sub>2</sub> < coal + CCS/CO <sub>2</sub>	?
2.	Electrification competitive in transport	electrification cost < hydrogen <= biofuels <= oil products	$\checkmark$
3.	Limited supply of renewables	renewables supply < total energy demand	$\checkmark$
4.	Gas competitive with renewables	gas price + CCS/CO <sub>2</sub> < marginal renewable	$\checkmark$
5.	Gas competitive with storage	gas price + CCS/CO <sub>2</sub> < storage <= hydrogen	?
6.	Secure gas supply	liquid, interconnected regional markets	$\checkmark$
